Its components are the Fire Trainer Simulator (FTS), the Interface and Control Unit (ICU), the Fire Trainer (FT) and the Fire Trainer Controller (FTC). The FTS simulates the various fire zones in the real world, the ICU communicates with the simulator and the training device control panel (TDC), while the FTC provides control over the fire zones and emergency and warning messages to the users. The system includes a first test, commonly referred to as the "Adoption Test", and training has been conducted by the United States Marine Corps with 1,000 soldiers. Further field testing has been carried out at the 1st Infantry Division at Fort Riley and the 1st Security Force Assistance Brigade. For the adoption and training of infantry, artillery, and tank soldiers and officers from all branches, the system is now in use across the United States. I have this function: function func(n) { return Math.max(n, n - Math.floor(n / 10)); } The idea is that when n = 1234567890, this function will return n - 90, instead of 12345679. I want to return the max time that was taken for the function to be called. For example, if I call func(1234567890), it takes 90 ms. If I call func(12345678910), it takes less than 5ms. Is there a way to calculate the time that was spent for the first call of the function? A: You can check the time when you do the math, that will let you know what part of your function takes the longest time. var start = Date.now(); var max = Math.max(n, n - Math.floor(n / 10)); return Math.max(max, Date.now() - start); var max = func(82157476af
